                                                                                                                                                                                                                                                                                          9
                                                    The present sequence encodes a modified annexin having an N-terminal chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular thrombi or apoptosis which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radionuclide and retain annexin bloactivity. It can be readily prepared in high radiochemical purity, in contrast to conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity.
                                                                                                                                                                                                                                                                      1 ATGCCATGTGGCTGCGGTCATATGGCACAGGTTCTCAGAGGCACTGTGACTTGCCT

The modified annexin is useful for imaging vascular thrombi or apoptosis which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radionuclide and retain annexin bloactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In contrast to conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence encodes a modified annexin having an N-terminal chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular thrombi or apoptosis which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radiounclide and retain annexin bloactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In contrast to conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           241 ACTGGAAAATTTGAAAAATTAATTGTGGCTCTGATGAAACCCTCTCGGCTTTATGATGCT

The vascular anti-coagulating protein (VAC)-alpha encoded by this cDNA is used in the preparation of monoclonal antibodies (WAbs). The VAC-alpha is injected into a host animal, in conjugation with egy keyhole limpet haemocyanin, and the B-cells from the immunised hosts are then fused with myeloma calls. The resultant hybridomas (WAA-8 and VAA-9) produce Abs specific to VAC-alpha. The Abs can be used as immunoassay reagents to detect VAC proteins, as affinity ligneds for purificn. of VACs and as medicaments for binding and/or neutralising VAC proteins in vivo. See also ANN91334 and EP-181445.

                                                                                                                                                                                                                                                     81
                                                         cription terminator in addition to the placental coagulation inhibitor gene. The polypeptide produced on culturing of transformed host cells exhibits strong anticoagulant activities and is useful for the treatment and prevention of eq thrombosis or disseminated intravascular coagulation in the brain, heart and peripheral blood vessels. This invention relates to a combination comprising several CDNAs that are differentially expressed in activated vascular tissue. The invention also discloses a high throughput method for detecting differentially expressed cDNAs in a sample. The CDNAs of the invention may have antiatrerlosclerotic; cytostatic; cardiant; hypotensive; antidiabetic; gynaecological; vasctropic and cerebroprotective activities and may be used in gene therapy. The cDNAs of the invention may be used in a molecule or compound that specifically binds a CDNA of the invention. A protein encoded by the CDNA may be used to screen several molecules or compounds to identify a molecule or compound that specifically binds a CDNA of the protein, or to produce or purify an antibody to the protein that can be used to detect a protein in a sample or purify an antural or recombinant protein from a sample. The uncleotides may be useful for diagnosing, staging, treating, or monitoring the progression of creaming the protein from a sample. The uncleotides may be useful for a vascular disease, e.g. atherosclerosis, cancer, coronary artery disease, hypertension, diabetes, pre-clampsia, ischaemia reperfusion injury, restenosis, or stroke. The cDNAs can also be used for large-scale genetic or gene expression analysis of several new

The protein is the result of expression of a fusion gene (this sequence) comprising the Annexin V gene and a low-molecular urokinase gene, in insect cells. The Annexin V-scu-PA-32 fusion protein, expressed in insect cells train Tn-5B1-4, has high affinity for active

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A human placenta cDNA library (Clontech) was screened to obtain this sequence. The cDNA does not contain a leader peptide sequence, indicating that PAP-I is probably not constitutively screted. The product binds to phospholipid and inhibits phopholipase A2. The protein can substitute heparin or other anticoagulants in the treatment of disseminated intravascular coagulation, deep vein thrombosis, or other disorders. It also has antiinflammatory
                                                                                                                                                                     PAP-1 cDNA from human placenta, used for anticoagulant production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò

                                                                                                                                                        This sequence, or a fragment of it, is used in the construction of DNA sequences encoding hybrid phospholipid-binding proteins (PBP) comprising at least one lipocortin phopholipid binding domain (PBD), or of PAP-I, joined to a gla-domainless vitamin K-dependent protein, e.g. protein C or activated protein C. See AAQ12680-81 for such examples:
A human placenta cDNA library was screened using affinity-burified antibody against PAP-I in order to obtain this cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 1460;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               453
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            513
                                                                                        The DNA is produced by determining the amino acid sequence of isolated and highly purified VAPs, constructing DNA probes on the basis of this sequence, using the probes to search through suitable cDNA libraries, isolating cDNA that hybridises with the probes, by inserting the cDNA into a suitable vector, and using the vector to transform a host organism. VAC-alpha has anticoagulant activity under certain conditions, but loses this activity in the event of severe bleeding. It acts by inhibiting conversion of factor X to factor Xa and conversion of prothrombin to thrombin. It is structurally related to lipocortin I (Nature, 320, 77, 1986) and lipocortin II (Cell, 46, 191/120, 1986) and has similar antilinflammatory and phospholipase inhibitory activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  840
organism. VAC-alpha has anticoagulant activity under certain conditions, but loses this activity in the event of severe bleeding. It acts by inhibiting conversion of factor X to factor Xa and conversion of prothrombin to thrombin. It is structurally related to lipocortin (Nature, 320, 77, 1986) and lipocortin II (Cell, 46, 191/120, 1986) and Ass similar antiinfalmamatory and phospholipase inhibitory activity. (Updated on 25-MAR-2003 to correct PR field.)

polynucleotide sequences AAF17982 - AAF18424 encode human lung cancer associated proteins represented in AAB58106 - AAB58540. Lung cancer associated proteins and polynucleotide sequences, their agonists, and antagonists may have neuroprotective; cytostatic; cardioactive; cardioactive; finmunomodulatory; muscular active general; vulnerary; gastrointestinal general; nephrotropic; antiinfective; ginecological; or antibacterial activity. The invention and info includes antibodies specific for the activity. The invention also includes antibodies specific for the protein or polynucleotide sequences. The lung cancer associated polynucleotide sequences. The lung cancer associated chromosome identification, as chromosome markers, and for numerous other disorders such as neural; immune, muscular, reproductive, casearch purposes. The proteins may be used to treat disorders such as neural; immune, muscular, reproductive, castorintestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases. Polynucleotide sequences AAF18433 and peptide AAB58549 are used in the course of the invention for the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ä
